

Clean

Remove all the washed grain from the keg.

Spray the urn, keg and pot with water and rub any deposits off with a paper towel.

Add 10 L of water back to the urn and heat it to boiling again.

When boiled, add some "keg and line cleaner".

Connect the pump to the tap on the urn with the out hose going to the keg.

Open the tap on the urn and turn on the pump to move all the water to the keg (with the keg tap closed).

Put any used hoses, spoons etc in the keg and make sure they get submerged.

When all the water is in the keg, open the tap and let it flow into the pot.

Finally give everything a final spray with water and dry with a tea towel.
